

EXPERIMENT 15: FEED FORWARD NEURAL NETWORK

Aim

To implement a simple Feed Forward Neural Network using Python.

Objective

To demonstrate the forward propagation process of a neural network.

Algorithm

1. Initialize input, weights and bias.
2. Calculate the weighted sum.
3. Apply an activation function.
4. Generate the output.
5. Display the result.

Flowchart

Code

$x = 2$

$w = 3$

$b = 1$

```
z = x * w + b
```

```
if z >= 5:
```

```
    output = 1
```

```
else:
```

```
    output = 0
```

```
print("Output =", output)
```

OUTPUT

A screenshot of a terminal window with a dark background. The text 'Output = 1' is displayed in a light blue or cyan monospaced font.

Result

The Feed Forward Neural Network produced the output successfully.

Conclusion

A Feed Forward Neural Network calculates the output by passing input through weighted connections and an activation function.
