

EXPERIMENT 17: DATABASE WITH NAME AND DOB

Aim

To create a Python database containing names and dates of birth.

Objective

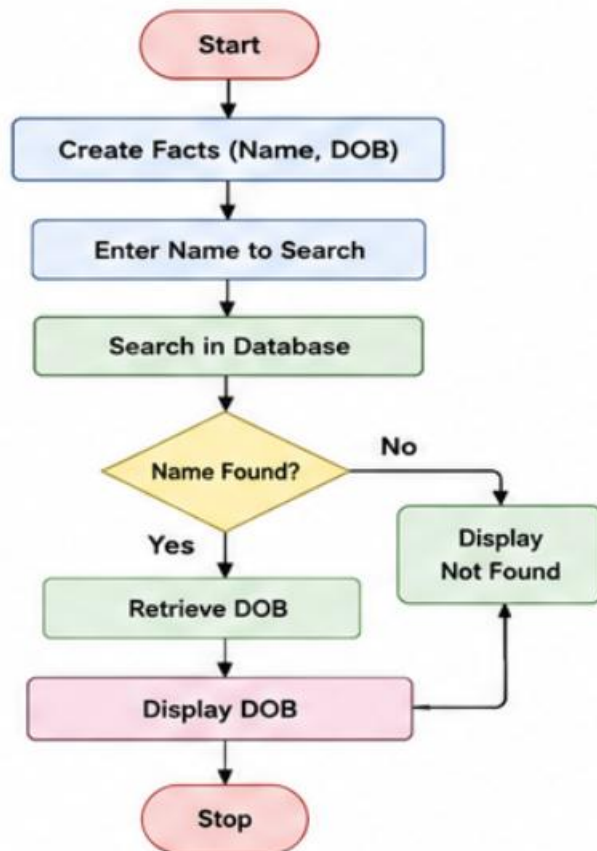

To store and retrieve the date of birth of a person using their name.

Algorithm

1. Start.
2. Create a database containing names and DOBs.
3. Read the name from the user.
4. Search for the name in the database.
5. If found, display the DOB.
6. Otherwise, display "Name not found".
7. Stop.

Flowchart

17. Prolog DB with Name and DOB

CODE

```
dob = {  
    "rohith": "15-10-2005",  
    "rahul": "20-05-2004",  
    "sita": "12-08-2005"  
}  
  
name = input("Enter name: ").lower()  
  
if name in dob:  
    print("Date of Birth:", dob[name])  
else:  
    print("Name not found")
```

OUTPUT

```
Enter name: rohith  
Date of Birth: 15-10-2005
```

Result

The person's date of birth was retrieved successfully.

Conclusion

The program demonstrates how a simple database can be created and searched using Python dictionaries.
