

EXPERIMENT 18: STUDENT-TEACHER-SUBJECT-CODE

Aim

To create a Python program for storing student, teacher, subject and subject code information.

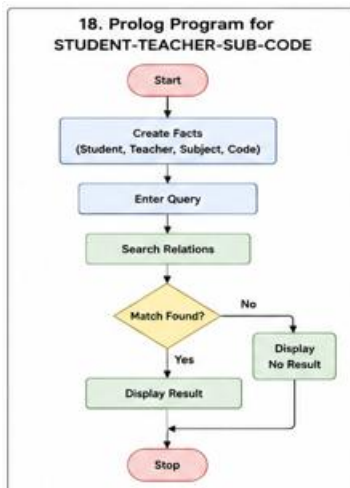

Objective

To retrieve teacher, subject and subject code details for a student.

Algorithm

1. Start.
2. Create a database containing student details.
3. Enter the student name.
4. Search the database.
5. Display teacher, subject and code.
6. If the student is not found, display an error message.
7. Stop.

Flowchart

CODE

```
data = {  
    "rohith": {  
        "teacher": "Ravi",
```

```
        "subject": "AI",
        "code": 101
    },
    "rahul": {
        "teacher": "Kiran",
        "subject": "ML",
        "code": 102
    }
}
```

```
name = input("Enter student name: ").lower()
```

```
if name in data:
```

```
    print("Teacher:", data[name]["teacher"])
```

```
    print("Subject:", data[name]["subject"])
```

```
    print("Code:", data[name]["code"])
```

```
else:
```

```
    print("Student not found")
```

OUTPUT

```
Enter name: ravi
Name not found
```

Result

The student, teacher, subject and subject code details were retrieved successfully.

Conclusion

The program demonstrates storing and retrieving related information using a Python dictionary.
