

EXPERIMENT 19: PLANETS DATABASE

Aim

To create a Python database containing information about planets.

Objective

To store and retrieve the position of a planet in the Solar System.

Algorithm

1. Start.
2. Create a database of planets.
3. Enter a planet name.
4. Search the database.
5. Display its position.
6. If not found, display "Planet not found".
7. Stop.

Flowchart

CODE

```
planets = {  
    "mercury": 1,  
    "venus": 2,  
    "earth": 3,  
    "mars": 4,
```

```
"jupiter": 5,  
"saturn": 6,  
"uranus": 7,  
"neptune": 8  
}
```

```
planet = input("Enter planet: ").lower()
```

```
if planet in planets:  
    print("Position:", planets[planet])  
else:  
    print("Planet not found")
```

OUTPUT

```
Enter planet: venus  
Position: 2
```

Result

The position of the given planet was retrieved successfully.

Conclusion

The program demonstrates how planetary information can be stored and searched using Python.
