

EXPERIMENT 14: DECISION TREE

Aim

To implement a Decision Tree using Python.

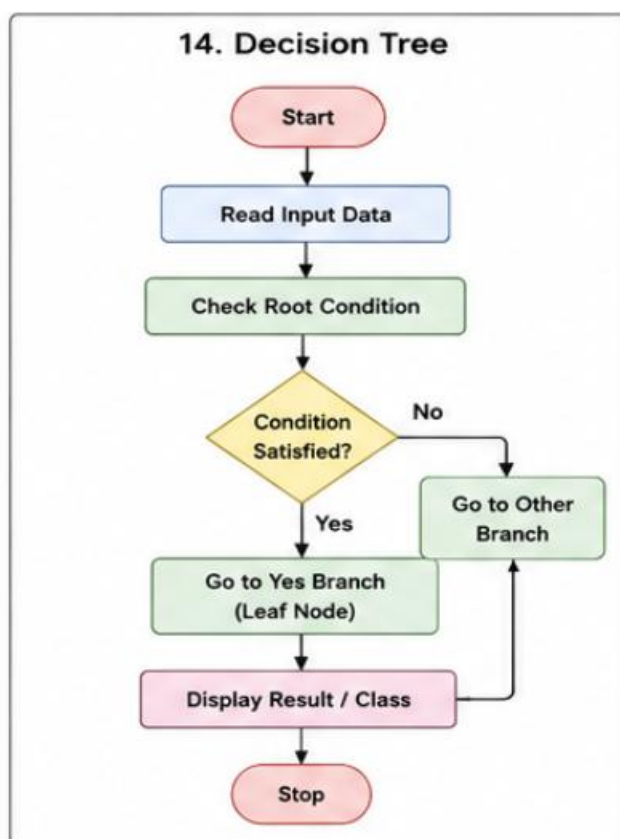

Objective

To classify data using simple decision rules.

Algorithm

1. Read the input data.
2. Select a decision condition.
3. Check the condition.
4. Classify the input.
5. Display the result.

Flowchart

Code

```
marks = int(input("Enter marks: "))
```

```
if marks >= 50:  
    print("Result: Pass")  
else:  
    print("Result: Fail")
```

OUTPUT :

```
Enter marks: 55  
Result: Pass
```

Result

The input was classified successfully using a Decision Tree.

Conclusion

The Decision Tree classifies data using a sequence of simple conditions.
